- Fully configurable over Ethernet with embedded web server.

The nanoDAQ-LTR is a new development by Chell Instruments utilizing the latest technology in digital transducers.

The nanoDAQ-LTR is now available in 16 and 32 channel forms in a ultra-miniature slim-line package. It features a Souriau 8STA0-06-9PN connector making it very suitable for motor sport and other on-vehicle applications.

The nanoDAQ-LTR is a fully configurable smart pressure scanner that will output pressure data in engineering units over Ethernet and CAN. The data output over all interfaces is identical to the nanoDAQ-LTR's sister products; the nanoDaq and the MicroDAQ3.

The nanoDAQ-LTR makes use of 17 or 35 absolute transducers which are thermally compensated and conditioned to provide 16 or 32 either absolute or differential measurements relative to one reference port.

The user can select a number of operating parameters using the embedded web server. These include; absolute or differential, TCP and UDP setup, data averaging and units, CAN setup and time stamp configuration.

The nanoDAQ-LTR features a hardware implementation of the IEEE 1588 PTPv2 time stamping protocol which allows the pressure data to be time stamped to a resolution of  $1\mu$ Second.

The nanoDAQ-LTR also features a hardware trigger allowing the pressure acquisition to be synchronised to an external TTL pulse.

The nanoDAQ-LTR is contained within a miniature package which is sealed to IP67 enabling it to be used in harsh environments. It is also available with alternative packaging to suit particular applications - please contact Chell for more details.

The transducers within the nanoDAQ-LTR have a very high proof pressure (50 psig or 90 psig depending on range) which reduces the chances of in-field transducer damage.
